Interoperability: Task 3

This task uses the Thrust library to sum the elements of a vector which has been computed before by means of OpenACC

Tasks

Check for the TODOs throughout the code in vecAddRed.c and thrustWrapper.cu.

The GPU-enabled call to thrust::reduce() should be implemented in thrustWrapper.cu. The wrapper function is defined as *extern* to prevent name mangling. Its call is to be implemented into vecAddRed.c.

Compile with make, run with make run.
